THE GVNR TOKEN

A VALUE DRIVEN MODEL OF SCARCITY AND DEFLATION

Kindest regards, the Governor

GVNR.XYZ

HELLO@GVNR.XYZ

TOKENOMICS & UTILITY

CORE PURPOSE

GVNR is a token-driven ecosystem where product protocol revenue channels value into $GVNR. The flagship near-term product, GVNR Diamond Hands, generates fees from Bitcoin-collateralised borrowing. Fees flow through a DAO-governed waterfall — securing operations and reserves before fuelling The Furnace buy-and-burn mechanism. $GVNR powers governance, staking, and places value on long-term scarcity, drawing inspiration from $BTC, $ETH, and the early $MKR model.

SUPPLY & DEFLATION

CAPPED AT 20 MILLION TOKENS, $GVNR INCORPORATES AN EIP-1559-INSPIRED BURN MECHANISM KNOWN AS "THE FURNACE."

This system gradually increases burn rates from 25% to 95% of fees as adoption and utility grows. The DAO governs adjustments to optimise for token scarcity and long-term value.

Burn intensity scales with adoption, and subject to the revenue waterfall, burns increase as product revenue matures.

VESTING & BURN

- 100% of $GVNR will be in circulation in December 2026, capitalising on a fast 18 month vesting period.
- At maturity, modelled burn rates could significantly reduce circulating supply over time, maximising scarcity and long-term value.

REVENUE MODEL

1. PRODUCT REVENUE

GVNR's near-term value accrual is driven by live and future pipeline products. Protocol fees are collected in and funnelled into GVNRs permissionless stablecoin UCD (the Ultimate Collateral Dollar). With $GVNR always programmatically burnt via a GVNR/UCD trading pair.

PRODUCT	STATUS	FEE SOURCES
GVNR Diamond Hands	Live H2 2026	3% origination (12-month term), 3% extension, PSM fees
GVNR Carry	Pipeline 2027	Delta-neutral BTC yield — fee model TBD
SmoothBrains AI	Pipeline 2027	Autonomous Execution Engine

DIAMOND HANDS — FEE DETAIL

FEE TYPE	RATE
Origination	3% APY (settled upfront over full term)
Extension	3% rollover per annual extension
Early Cancellation penalty	1%
Peg Stability Module	Market-driven

Bitcoin-native CDP — borrow UCD against native BTC without selling. Fees denominated in UCD.

2. REVENUE WATERFALL

Protocol fees follow a DAO-governed priority order. Operations and project sustainability come before aggressive token burns.

1. DAO opex & project security — runway, development, audits, and ongoing operations
2. Reserve fund — buyer of last resort for protocol stability*
3. Staking rewards + The Furnace — remaining surplus; Furnace uses UCD as the primary buy pair to purchase and burn $GVNR

**Future hedging via perps or futures may be employed. Details TBD.*

**Future hedging via perps or futures may be employed. Details TBD.*

FUTURE PROTOCOL REVENUE

Since launching GVNR, the blockchain landscape has shifted significantly, as value has been funnelled into Bitcoin and Ethereum; primarily due to political heads winds and regulatory restrictions. The GVNR network's original vision remains, with revenue generation targeted from annualised protocol access via time-bound NFTs for cross chain foundations. Transaction fees on these connected chains will also supplement the revenue waterfall. Initially however, GVNR's immediate focus is with our flagship Dapp **Diamond Hands**, with BTCFi now taking centre stage in crypto, where the lion share of liquidity rests - and GVNR will unlock that value into Ethereum and enable over collateralised money flow from Bitcoin, throughout the DeFi landscape.

3. LOCKING & GOVERNANCE

Locking of $GVNR can be utilised, to reward commitment and long term engagement with the project. Rewards are funded from revenue waterfall (after opex and reserve obligations are met).

Ecosystem Pipeline

GVNR DIAMOND HANDS	GVNR CARRY	SMOOTHBRAINSAI	GVNR NETWORK
Near-term revenue	Pipeline	Future	Future
Bitcoin-native CDP. Fees in UCD from origination, extension and PSM activity.	Delta-neutral yield on native Bitcoin. Fee model TBD. Will contribute to the revenue waterfall when live.	Automonous Execution Engine enabling decentralise and democratised access to institutional grade quantatative analystics and Ai trade signals. Fee model TBD.	Cross-chain infrastructure. Chain membership NFT revenue when protocol ships.

THE FURNACE MECHANISM

AUTOMATED BUY-AND-BURN SYSTEM INSPIRED BY EIP-1559.	PROJECTED SUPPLY BURN: HIGH DEFLATIONARY PRESSURE COULD REDUCE SUPPLY TO ZERO WITHIN FIVE YEARS AS ADOPTION ACCELERATES.
BURN RATE STARTS AT 25% IN YEAR ONE, SCALING TO 95% OVER TIME.	

Primary buy pair: GVNR/UCD. Product protocol fees denominated in UCD feed The Furnace once waterfall obligations are satisfied.

The 25%–95% burn rate applies to the burn-eligible portion of protocol revenue — not gross fees. The DAO prioritises opex and reserves before increasing burn intensity.

HIGHLIGHTS

MULTIFACETED UTILITY

- **Fee Payments:** Protocol fees from GVNR products are collected in UCD. Surplus flows to The Furnace with programatic buy and burn of $GVNR. Membership NFTs for chain access remain a future protocol utility, subject to BTCFi demand on other chains.
- **Locking & Governance:** Nodes lock $GVNR, earning rewards from protocol fees. The DAO manages burn rates, fee allocation, and policy decisions.

DESIGNED FOR GROWTH & ADOPTION

- **Product-Led Demand:** Diamond Hands CDP activity generates UCD-denominated fees, creating sustainable buy pressure for $GVNR via The Furnace.
- **Future Protocol Access:** Chains will join the GVNR Network via $GVNR-backed NFTs, priced in USD for budget predictability.
- **DAO Flexibility:** Governance enables dynamic adjustments, incentivising participation and optimising resource allocation.
